CSE 6213
Natural Language Processing
Lecture - 1

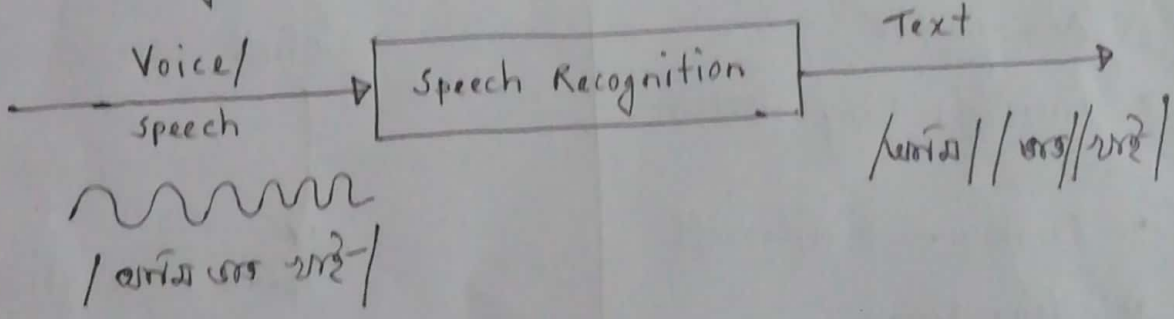

Natural Language Processing: (NLP)

It is a subfield of linguistics, computer science, and artificial intelligence concerned with the interactions between computers and human language, in particular how to program computers to process and analyze large amounts of natural language data.

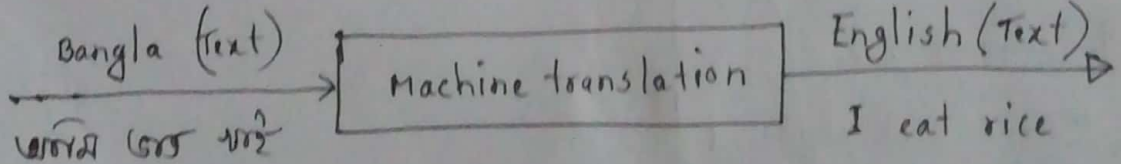

What is natural language processing with example?

We can use NLP to create systems like speech recognition, machine translation, Speech Synthesis, document summarization, Question answering system, spam detection and so on.

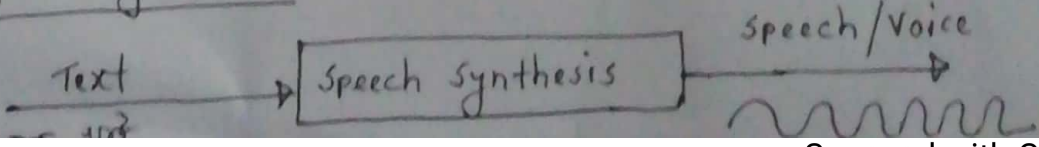

Speech Recognition: (STT → Speech to Text)

Machine translation: (MT → Machine Translation)

Speech synthesis: (TTS → Text to Speech)
