Morphology

Lecture-04
Dr. Md. Nurul Huda
Computational Linguistics

Morphology:

- Scientific study of word formation
- study of patterns of word formation
- How words are orginated, grammatical forms, on what basis the word class is formed.

Word:

A word is a minimal free form of a language that has a given sound, meaning and syntactic function.

Language:

- An arbitrary vocal system used for human communication
- Elements in a language are arranged according to certain rules, but not at random.
- Elements at a lower level are combined according to certain rules to form elements at a higher level.

Lexicology:

- A branch of linguistics concerned with the study of the vocabulary of a given language.
- Deals with words, their origin, development, structure, formation, meaning and usage

Morpheme:

- Minimal, meaningful unit of a word or in the grammar of a language.
- Not further divisible or analyzable into smaller forms.
- Breaking up morpheme loses its identity and leaves its meaningless noises

Scanned with CamScanner

- May be a word or not a word
- A synonym for morpheme is glosseme

Example:

Unladylike ⟶ Un + lady + like

Encouragement ⟶ En + courage + ment

Disillusionment ⟶ Dis + illusion + ment

Morph:

- A morph is the phonetic realization of a morpheme.
- The actual utterance of the morpheme.

Allomorph:

- Allomorph is phonologically distinct variants of the same morpheme
- Different realization, manifestation of the same morpheme.

Examples of Allomorph:

[s] ⟶ English plural morpheme

[-s]

cat	thank
cats	thanks

Here [-s] with morphs ending in /p, t, k/

[-z]

dog	rim
dogs	rims
↓	↓
dogz	rimz

Here [-z] with morphs ending in /b, d, g, v, l/

[-iz]

bus	horse
buses	horses

Here [-iz] with morphs ending in /z, t/

Scanned with CamScanner

Morpheme types

- Free morpheme

(A free morpheme is a word that can occur by itself)

(It can stand alone)

(We can add other morphemes in it)

Example: boy, man, establish are free morphemes

- Bound morpheme

(A grammatical unit that never occurs by itself, but is always attached to some other morphemes)

Examples:

Bound Morpheme	Words
[s]	cats
[ness]	kindness
[ize]	visualize

Affixation

An affix is a bound morpheme that is joined before, after or within a root or stem

Types of affixes

- Prefix

(Added before the root or stem of the word)

Example: Unpredictable, Unresponsive, reschedule, etc

- Suffix

(Attached to the end of a root or stem)

Example: cats, eaten, eating, higher, highest

- Infix

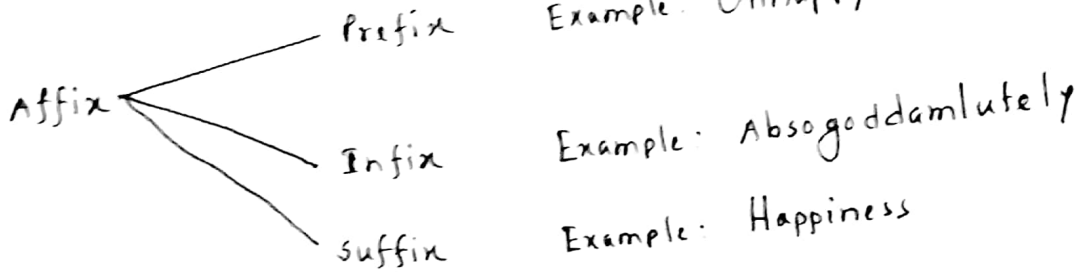

(Inserted within a root or stem)

(Added in the base form of a word to create a new word or intensify meaning)

Scanned with CamScanner

Example:

Absogoddam lutely

- Circumfixes:

Consists of two parts

- A prefix and a suffix that together create a new word

Example:

In Dutch 'berg' means 'mountain'

ge-berg-te means mountain chain

- Simulfix:

A simulfix is a change or replacement of vowels or consonants (usually vowels) which changes the meaning of a word

Example:

eat ⟶ ate

tooth ⟶ teeth

Morphemes and classes

- Root

(A root is the irreducible core of a word, with absolutely nothing else attached to it)

Example:

jump – jumps
jump – jumping
jump – jumped

} Here, jump is the root

Scanned with CamScanner

stem

A stem deals with inflectional morphology
(Inflectional only, but not derivational affixes added to it)

Example:

friend ⟶ friends
friendship ⟶ friendships
greenhouse ⟶ greenhouses

worker ⟶ workers
shift ⟶ shifted

The stem is that part of a word that exists before the addition of any inflectional morpheme.

- Base

A base is any form to which affixes of any kind can be added.
It can be both inflectional or derivational

boy ⟶ boys
boy ⟶ boyish
boy ⟶ boyhood

[All roots are bases, bases are called stem in context of inflectional morphology]

Bound Morpheme

Definition: must be attached to another morpheme

Bound Morpheme

Derivational morpheme
a. may change syntactic class
b. to form new words
c. examples: -able, un-, re-, etc

Inflectional morpheme
a. Different forms of the same word
b. Not change syntactic class
c. Only 8 kinds in English:
-'s, -s (plural nouns), -ing, -ed/-e
-est, -er, -s (SV agreement)

Scanned with CamScanner

Formation of new words:

1. **Derivational Morpheme**

- Adding an affix to the root or stem
- changing the meaning of the base to which they are attached

a) changing the meaning of the base to which they are attached

kind ⟶ unkind (Adjectives)

obey ⟶ disobey (Verbs)

b) by changing the word-class that a base belongs

kind ⟶ kindly

simple ⟶ simply

Derivation of Nouns:

Verb ⟶ Noun

speak ⟶ Speaker

swim ⟶ Swimming

read ⟶ read / reading

Adjective ⟶ Noun

kind ⟶ kindness

good ⟶ goodness

black ⟶ blackness

Noun ⟶ Noun

mother ⟶ motherhood

sense ⟶ non-sense

Derivation of Adjective:

Noun ⟶ Adjective

master ⟶ masterly

brother ⟶ brotherly

Verb ⟶ adjective

read ⟶ readable

love ⟶ loveable

Scanned with CamScanner

jective ⟶ Adjective

common ⟶ uncommon

possible ⟶ impossible

Derivation of Verbs

Noun ⟶ Verb

analysis ⟶ analyze

slave ⟶ enslave

Adjective ⟶ Verb

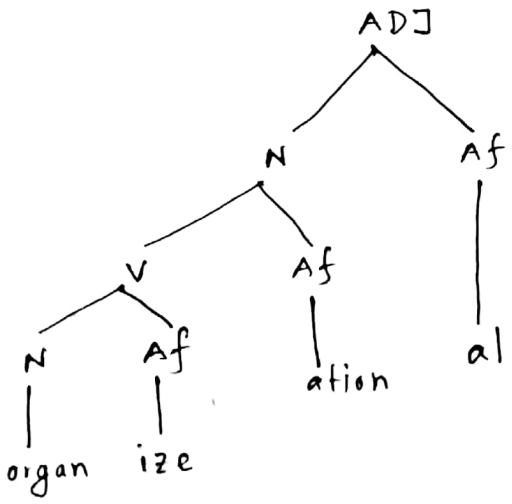

rich ⟶ enrich

legal ⟶ legalize

Verb ⟶ verb

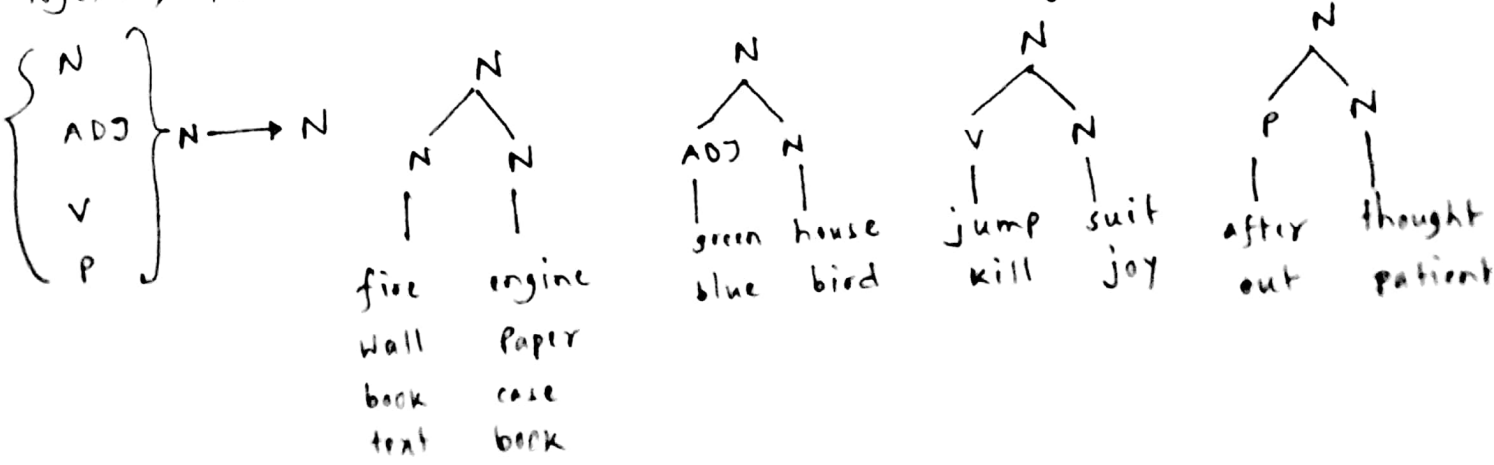

continue ⟶ discontinue

pack ⟶ Unpack

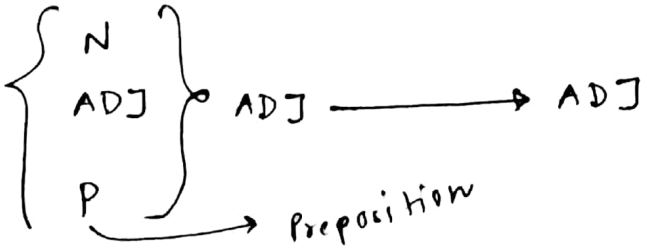

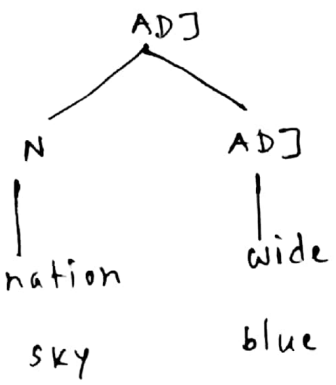

Compounding

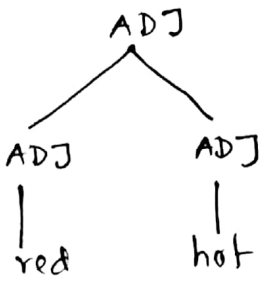

When two words or at least two root morphemes are joined together, the derived word results a compounding.

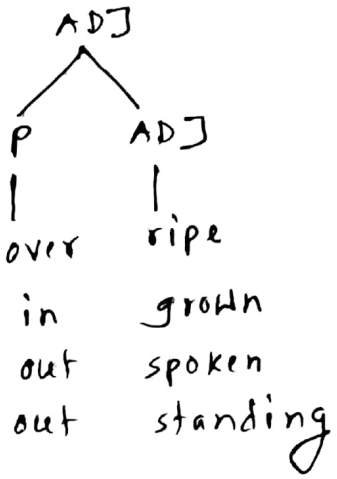

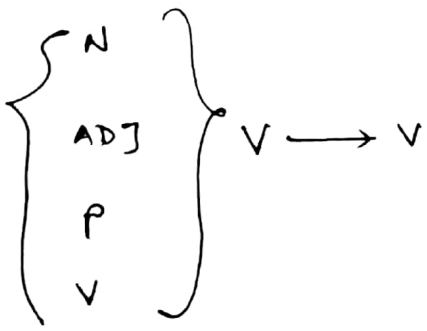

Scanned with CamScanner

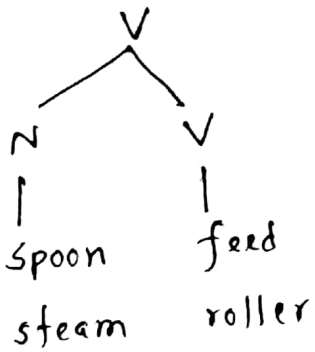

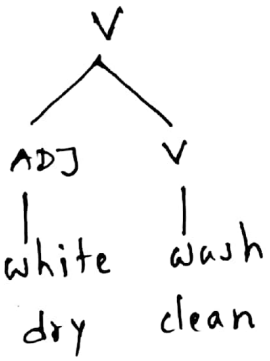

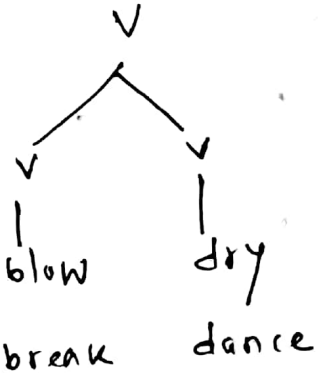

Scanned with CamScanner

Duplication

- In this process all or part of the base is repeated as prefix or suffix
- Full or partial repetition of a free morpheme; sometimes with variation

Full	With variation
so-so	zigzag
bye-bye	dilly-dally
	hotch potch
	hodge podge
	mishmash
	willy-nilly
	hanky-panky

Blending:

Similar to compounding, but parts of the free morphemes involved are lost
(Usually 1st part of 1st word + end of 2nd word)

Word 1	Word 2	Word
breakfast	lunch	brunch
smoke	fog	smog
motor	hotel	motel
news	broadcast	newscast

Clipping (clipped forms)

Part of a free morpheme is cut off (i.e., shortening a polysyllabic word); often in casual speech.

Professor ⟶ Prof.
advertisement ⟶ ad
document ⟶ doc
Laboratory ⟶ lab
Automatic ⟶ auto

Scanned with CamScanner

Acronyms:

Abbreviate a longer term by taking the initial letters

Example:

NATO (North Atlanic Treaty Organization)
TOEFL (Test of English as a Foreign Language)
AIDS (Acquired Immune Deficiency Syndrome)
NASA (National Aeronautics & Space Administration)

If unpronounceable ⟶ each letter is sounded out separately

ATM (Automatic teller machine)
VCR (Video cassette Recorder)

Back formation

A word (usually a noun) is reduced to form another word of a different type (usually a verb).

editor ⟶ edit
donation ⟶ donate
babysitter ⟶ babysit
terminator ⟶ terminate

[The direction of derivation is inverted]

먹기 ⟶ 먹

Coining

Creating a completely new free morpheme, which is unrelated to any existing morphemes; a rare thing

Example: googol
Nylon

Scanned with CamScanner

Conversion

In some languages it is possible to form new lexeme merely by shifting the word category without adding any affixes.

Example:

table ⟶ to table
chair ⟶ to chair
water ⟶ to water

Onomatopoeia:

Words imitate sounds in nature

Example:

A cat ⟶ meow
A cow ⟶ moo
Ring of a bell → ding-dong

Extension of word formation rules

ham<u>burger</u>
cheese<u>burger</u>
fish <u>burger</u>

mara<u>thon</u>
tele<u>thon</u>

alco<u>holic</u>
worka<u>holic</u>

[part of a word is treated as a morpheme though it's not]

Synthetic Compound

The head lexeme is derived from a verb

Example:

hand – <u>washing</u>
User – <u>driven</u>
home – <u>made</u>

Scanned with CamScanner

Portmanteau

When a single morpheme represents simultaneously two or more grammatical functions is called portmanteau morpheme.

Example:

[-s] is used to denote 3rd person singular number
[-s] is used to denote plural number

* Run ⟶ Run ⟶ Run
  cut ⟶ cut ⟶ cut

A Single Word with different morphemes

- One morpheme – nation
- Two morphemes – national
- Three morphemes – national -ize
- Four morphemes – de nation al ize
- More than four morphemes – de nation al iz ation

Scanned with CamScanner
